ApexSQL Clean

for SQL Server 2000 and 2005

The Industry Standard for SQL Server Database Analysis & Cleanup

ApexSQL Clean is the Industry leading Analysis and Cleanup tool for Microsoft SQL Server. It offers you the ability to safely remove unreferenced objects from your databases. Moreover, it is a powerful tool in quantifying the impact of database changes on your database objects and even client applications.

Use ApexSQL Clean to:

- Analyze databases to see what external and internal references exist among databases and database objects.
- Analyze client applications for references to procedures, tables, and other database objects embedded in the source code.
- Safely remove unreferenced and unused database objects like tables, views, and procedures from within the database (cross-dependencies) and from client applications like VS.NET projects.
- Visualize database object dependencies with a proprietary dependency parser that doesn't rely on SQL Server's *sysdepends* table.
- Dynamically browse and navigate through your object dependencies using the powerful Graphical Dependency Viewer.
- Create XML exports or HTML reports to help your team create pre-impact analysis and realistic time and effort estimates for any planned changes on your databases.
- Print and save your target diagrams in a variety of graphical formats.
- Automate dependency analysis by using the integrated powerful Command Line Interface.

"Thank you for the links and the great deal. I just made the purchase. Great tools!! I look forward to working with your company in the future as you add more tools. Thanks for the effort to produce quality applications."
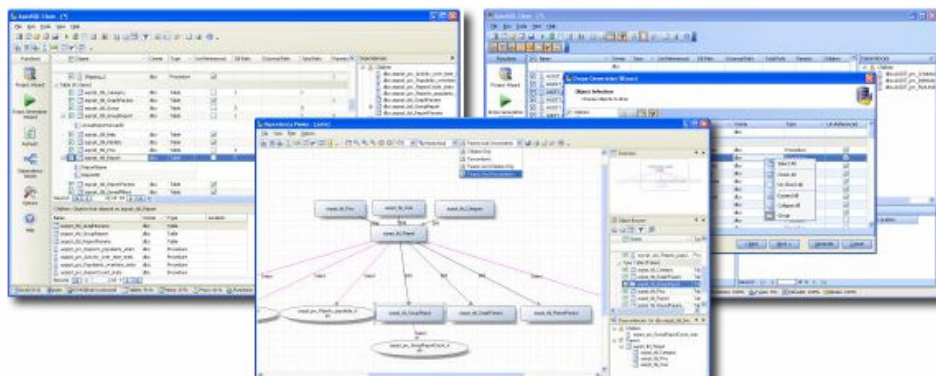

Kim Rossey

ApexSQL
SQL Developer Essentials

ApexSQL Clean's Key Features

- Powerful impact Analysis tool with a Graphical Dependency Viewer
- Graphical display of the number of unreferenced objects
- Shape and color for each database object in the Dependency Viewer can be customized and saved to a profile for import/export
- Trace dependencies all the way into client application source code files using a recursive file processing engine that can search a directory and all its subdirectories
- Generate scripts that perform risk-free deletion through the tool's automatic detection of unused objects in your SQL Server databases
- Column level dependencies for Tables and Views
- Proprietary dependency parsing algorithms for SQL Server that provide accurate analysis vs native SQL Server methods that use the *sysdepends* table
- New Auto-update feature ensures an always up-to-date ApexSQL Clean
- Powerful Regular Expression-based filter that allows viewing down to the individual object level
- DDL script for object colorizes referenced object names to allow you to immediately spot the dependencies
- Wizard style interface with Graphical treeview control makes navigation quick and easy
- XML Export for further analysis in other applications such as Microsoft Excel
- Command Line Interface with scores of switches included in the base price of the product. No extra charges
- Full SQL Server 2005 Support
