

**ApexSQL Report** is the Industry leading Reporting tool for Microsoft SQL Server. It is a data driven, web reporting tool for Microsoft SQL Server. It offers you the ability to generate literally hundreds of reports from an existing database in a few minutes rather than weeks or even months. It is the first and only reporting solution designed specifically for SQL Server database users.

If you have a SQL Server database, ApexSQL Report can help you generate sophisticated HTML reports, graphs, and Excel spreadsheets without complicated server component installations. You can even export your reports to PDF!

Apex SQL Report works with your existing stored procedures by extending their output directly to your desktops—in the format that you want.

"...I have to say this product is seriously easy to use! I'm getting reports online at a mad rate right now. Considering that I couldn't build a Web page with anything other than static HTML on it if I had to save my life, being able to build reports this way is immensely valuable to me and the company I work for. I'll probably continue pestering you with technical questions and feature requests, but I thought I should mention this is a great product just with what I can already do with it."

## ApexSQL Report's Key Features

- Support for FusionCharts 2.0
- Report Wizard that will walk you through the process of creating your own reports
- Tabbed interface that simplifies UI navigation
- Ability to export to Excel and PDF
- Supports various graph formats including pie and pipe charts, bar graphs, donut graphs, area graphs, and multi-series graphs. You should be able to find a graph to fit any report you need
- Comes with a full copy of FusionCharts 2.0 developer license. Includes help file, implementation guide, and .fla file to customize look and feel of graphs
- Reports, users, and passwords can be created, edited, and deleted all in one online administration console
- Powerful treeview control grouped by report category for automatically generated reports
- HTML reports that allow pagination and column sorting
- Ability to create client side report filters to ensure that only the reports and records that you want are displayed
- SQL Server 2005 support
