This added utility is built into File-Rescue Plus. The product allows you to do the opposite of what File-Rescue Plus does. Once you have run a scan you may notice that there is still many files that actually still exist on your workstation. Some may be confidential, but how do you really delete a file?

Clean Free Disk Space allows you to overwrite unused disk space on your hard drives. This is where all deleted files are stored. It gives you the option of running a wipe over that space one time or up to 3 times to ensure complete corruption or erasure of all data. Three wipes of the data is up to Department of Defense standards in the U.S.A. You can be ensured that data will be un-recoverable after this wipe.

- Overwrite Free Space with zeros once.

- Complies with Department of Defense Standards 5220.22-M.
